

Practical Assignment - 2: Log Analysis using Sawmill Log Analyzer

Task 1: Installation of Sawmill

Step 1: (<https://www.sawmill.net/download.html>)

The image shows two screenshots related to the installation of Sawmill. The top screenshot is a web browser displaying the Sawmill download page. The page features the Sawmill logo, navigation links (Home, Products, Downloads, Purchase, Support, Samples, About), and a prominent 'Download Sawmill 8.8.1' button. Below this, there's a section for 'DOWNLOAD SAWMILL' with a table showing the selected operating system (Microsoft Windows) and hardware architecture (x64). The page also includes installation instructions and a hardware requirements section, which is highlighted with a red box. The bottom screenshot shows the 'Sawmill Setup' window. It prompts the user to choose a username and password for the Root Administrator. The username 'aastha' is entered, and the password is masked with dots. A 'Reenter password' field is also present. At the bottom, there are '< Back' and 'Next >' buttons.

Operating system Microsoft Windows

Hardware architecture x64 (64-bit; e.g., i5, i7, Intel EHT54, AMD Opteron, AMD64, Mac Pro)

The version of Sawmill you selected (above) is now downloading. If the download does not start within the next few seconds, you can start it manually by clicking [here](#).

You can verify the authenticity of this download with the a [PGP signature](#) for this file — our [public key](#) is [here](#).

You can also verify the download using this MD5 signature: 4ddc1506679c7e921012aab9ab8ce388

INSTALLATION INSTRUCTIONS

Hardware requirements: Sawmill works best on a 64-bit operating system with 2GB of RAM per core. Its database requires up to four times the disk space of the uncompressed log data. If you are processing more than 10GB of log data (uncompressed), use of a 32-bit operating system or insufficient memory or disk space may result in errors or crashes. For more details see the [System Requirements page](#).

Detailed instructions: The instructions below are brief instructions for this platform only. For more detailed installation instructions for all platforms, see the [online Installation documentation](#).

The file being downloaded is a Windows installer. You can either save the file on your hard drive and open it after it's done downloading, or you can tell your browser to open it immediately after downloading.

After you start the installer, follow the instructions in the installer windows to install Sawmill. After the installation is done, you can immediately start using a web browser (a browser window should appear after installation). Sawmill normally runs its own web server on your computer, and you use it through a web browser on your computer, which is fine for most purposes. If you would rather run Sawmill as a CGI program under a Windows-based web server, then you need to use the Sawmill.exe file, which can be found in the Sawmill installation folder (normally C:\Program Files\Sawmill 8.8). You do not need to install the Windows Console component during installation. If you will be running Sawmill exclusively in CGI mode, come the

Sawmill Setup

Root Administrator

Please choose a username and password for the Root Administrator.
Note, you will need to enter this username and password whenever you access Sawmill in the future.

We can even create a new report

Task 2

- A) Identify total number of log entries. Hits 1,000,000
- B) Determine distribution of HTTP methods (GET, POST, PUT, DELETE).
Majority of requests were GET requests, followed by minimal POST requests.
PUT and DELETE requests were negligible.
- C) List top 10 source IP addresses by request volume.

- D) Identify the most frequently targeted URI

E) **What percentage of total requests resulted in 4xx errors?**

A high percentage of 4xx errors often indicates "directory busting," where an attacker uses an automated tool to guess file names.

$(\text{Total 4xx Errors} / 1,000,000 \text{ Total Hits}) * 100$ - around 28 to 30%

The Hostnames report shows 999,865 unique IP addresses out of 1,000,000 log entries, with most IPs making only 1–2 hits. The session duration is 00:00:00 and the bounce rate is very high (near 100%). This indicates there was no real user interaction. These patterns strongly suggest automated bot activity, vulnerability scanning, or botnet-based attacks rather than normal human users.

G) **Identify unusual or invalid IP address patterns and explain their significance.**

Abnormal IP traffic patterns and zero-duration sessions indicate possible spoofed or distributed bot traffic.

H) **Could IP spoofing be occurring? Support your answer.**

Seeing the same User-Agent string across dozens of different geographically dispersed IPs can be a sign of a distributed botnet or spoofing.

I) Identify any privilege escalation or administrative manipulation attempts.

Access attempts to administrative paths suggest possible privilege escalation attempts.

J) Assign a severity level (Low/Medium/High/Critical) and justify.

Severity Level: HIGH

Because: Automated attack patterns are detected, Administrative endpoints were targeted, and Significant client-side errors were observed.
